# NoSQL Database Design

COMP23111 – Database Systems

**Gareth Henshall** 

Lecturer in Computer Science

## **Data Modelling Overview**

Camera Space

### The balancing act!

**Application Needs** 

Database Performance Data Retrieval Patterns

### We must consider its data usage:

- Queries
- Updates
- Data Processing

### **NoSQL Relaxes some Strict Constructs**

- Schema
- Document Structure
- Atomicity

Data Modelling Overview (Schema)

Camera Space

Collections in NoSQL (MongoDB) do not require document schema by default (SQL Databases require a Schema before Data Insertion)

Data types for each field in a collection may differ across documents within the same collection

Changing a documents structure is as simple as updating the document directly

n.b. We can enforce schema in NoSQL (MongoDB)

## Data Modelling Overview (Document Structure)

Camera Space

### NoSQL Databases allow for both a:

- Normalised Schemas
- Denormalised Schema

In MongoDB these are know as embedding & referencing respectively

### **Embedding**

- Captures relationships between data by storing data in a single document structure
- Achieved by embedding document structures in a field or array within a document

### Referencing

- Stores the relationships between data by including links or references from one document to another
- Resolved to access the related data

### Camera Space

## Data Model Design (Embedded)

```
id : <ObjectId1>,
name : "Smith",
products : [{←
                                                      Product: one-to-many
      code: "A-547",
      name: "iPhone 8",
      details: "Price: $850.00 and FREE shipping"

    Embedded sub-document

      code: "A-549",
      name: "MacBook Pro",
      details : "Price: $1800.00 and FREE shipping"
}],
                                                       Contact: one-to-one
contact : { ←
      address: "Oxford Road, M15 6GH",
      phone: "+447872222222"
```

### When Should we Embed?

Camera Space

### Embedding is advisable when:

Related items are frequently used or fetched together

There is a one-to-one relationship between two documents

The document, that will be embedded, is not a key document.

Data does not change or does not grow much

Related documents have similar volatility

## **Data Model Design** (Referencing)

Camera Space

### Product document

```
id : <ObjectId1>,
customer id : <ObjectId1>,
products : [{
       code : "A-547",
       name: "iPhone 8",
       details: "Price: $850.00 and FREE shipping"},
       code: "A-549",
       name : "MacBook Pro",
       details : "Price: $1800.00 and FREE shipping"
```

```
id : <ObjectId1>,
name : "Smith"
```

User document

#### Contact document

```
_id : <ObjectId1>,
customer_id : <ObjectId1>,
contact : ₹
       address: "Oxford Road, M15 6GH",
       phone: "+447872222222"}
```

### When Should we Reference?

Camera Space

### Referencing is advisable when:

When embedding would result in substantial data duplication

When embedded documents grow

To present more complex "many-to-many" relationships

The document, that will be embedded, is a key document

Requirement for fast writes

Camera Space

## **Data Model Examples**
